

CEERS | Barred Galaxy Candidate Report

CEERS mosaic and detection context

Mosaic: hlsp_ceers_jwst_nircam_nircam5_f444w_dr0.6_i2d.fits (F444W) | Pixel scale: 0.0300 arcsec/pixel

Diffraction-based PSF estimate: FWHM 0.141 arcsec (4.70 pixels); Gaussian sigma 1.99 pixels; PSF half-maximum disk area 17.32 pixel² (0.0156 arcsec²).

Candidate summary

Barred fraction: (21 strongly + 63 weakly) / 276 detected galaxies = 30.4%

Strong candidates: 21 | Weak candidates: 63 | Total candidates: 84 | Median bar b/a: 0.604 | Median bar eccentricity: 0.797

Method: high-intensity connected candidate region, weighted second moments, and the notebook's b/a thresholds (strong < 0.40; weak 0.40-0.60). Bar PA follows the fitted major axis, measured east of north. The line shows the fitted moment ellipse and the cross its center; neither marks an independently fitted structural bar. Bar length is intentionally blank.
