

CEERS | Barred Galaxy Candidate Report

CEERS mosaic and detection context

Mosaic: hlsp_ceers_jwst_nircam_nircam8_f444w_dr0.6_i2d.fits (F444W) | Pixel scale: 0.0300 arcsec/pixel

Diffraction-based PSF estimate: FWHM 0.141 arcsec (4.70 pixels); Gaussian sigma 1.99 pixels; PSF half-maximum disk area 17.32 pixel² (0.0156 arcsec²).

Candidate summary

Barred fraction: (4 strongly + 38 weakly) / 305 detected galaxies = 13.8%

Strong candidates: 4 | Weak candidates: 38 | Total candidates: 42 | Median bar b/a: 0.545 | Median bar eccentricity: 0.838

Method: high-intensity connected candidate region, weighted second moments, and the notebook's b/a thresholds (strong < 0.40; weak 0.40-0.60). Bar PA follows the fitted major axis, measured east of north. The line shows the fitted moment ellipse and the cross its center; neither marks an independently fitted structural bar. Bar length is intentionally blank.

Weakly Barred Galaxies

CEERS | physical source 00016
